Package 'MPV'

April 12, 2015

Title Data Sets from Montgomery, Peck and Vining's Book

Version 1.38

Author W.J. Braun

Description Most of this package consists of data sets from the textbook Introduction to Linear Regression Analysis (3rd ed), by Montgomery et al. Some additional data sets and functions useful in an undergraduate regression course are included.

R topics documented:

`cement` *Cement Data*

Description

The `cement` data frame has 13 rows and 5 columns.

Usage

```
data(cement)
```

Format

This data frame contains the following columns:

y a numeric vector

x1 a numeric vector

x2 a numeric vector

x3 a numeric vector

x4 a numeric vector

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(cement)
pairs(cement)
```

`GANOVA` *Graphical ANOVA Plot*

Description

Graphical analysis of one-way ANOVA data. It allows visualization of the usual F-test.

Usage

```
GANOVA(dataset, var.equal=TRUE, type="QQ")
```

Arguments

`dataset`	A data frame, whose first column must be the factor variable and whose second column must be the response variable.
`var.equal`	Logical: if TRUE, within-sample variances are assumed to be equal
`type`	"QQ" or "hist"

Value

A QQ-plot or a histogram and rugplot

Author(s)

W. John Braun

Source

Braun, W.J. 2013. Naive Analysis of Variance. Journal of Statistics Education.

`GFplot` *Graphical F Plot for Significance in Regression*

Description

This function analyzes regression data graphically. It allows visualization of the usual F-test for significance of regression.

Usage

```
GFplot(X, y, plotIt=TRUE, sortTrt=FALSE, type="hist", includeIntercept=TRUE, labels=FALSE)
```

Arguments

- `X` — The design matrix.
- `y` — A numeric vector containing the response.
- `plotIt` — Logical: if TRUE, a graph is drawn.
- `sortTrt` — Logical: if TRUE, an attempt is made at sorting the predictor effects in descending order.
- `type` — "QQ" or "hist"
- `includeIntercept` — Logical: if TRUE, the intercept effect is plotted; otherwise, it is omitted from the plot.
- `labels` — logical: if TRUE, names of predictor variables are used as labels; otherwise, the design matrix column numbers are used as labels

Value

A QQ-plot or a histogram and rugplot, or a list if plotIt=FALSE

Author(s)

W. John Braun

Source

Braun, W.J. 2013. Regression Analysis and the QR Decomposition. Preprint.

Examples

```
# Example 1
X <- p4.18[,-4]
y <- p4.18[,4]
GFplot(X, y, type="hist", includeIntercept=FALSE)
title("Evidence of Regression in the Jojoba Oil Data")
# Example 2
set.seed(4571)
Z <- matrix(rnorm(400), ncol=10)
A <- matrix(rnorm(81), ncol=9)
simdata <- data.frame(Z[,1], crossprod(t(Z[,-1]),A))
names(simdata) <- c("y", paste("x", 1:9, sep=""))
GFplot(simdata[,-1], simdata[,1], type="hist", includeIntercept=FALSE)
title("Evidence of Regression in Simulated Data Set")
# Example 3
GFplot(table.b1[,-1], table.b1[,1], type="hist", includeIntercept=FALSE)
title("Evidence of Regression in NFL Data Set")
# An example where stepwise AIC selects the complement
# of the set of variables that are actually in the true model:
X <- pathoeg[,-10]
y <- pathoeg[,10]
par(mfrow=c(2,2))
GFplot(X, y)
```

```
GFplot(X, y, sortTrt=TRUE)
GFplot(X, y, type="QQ")
GFplot(X, y, sortTrt=TRUE, type="QQ")
X <- table.b1[,-1]  # NFL data
y <- table.b1[,1]
GFplot(X, y)
```

`GRegplot` *Graphical Regression Plot*

Description

This function analyzes regression data graphically. It allows visualization of the usual F-test for significance of regression.

Usage

```
GRegplot(X, y, sortTrt=FALSE, includeIntercept=TRUE, type=c("hist", "dot"))
```

Arguments

`X`	The design matrix.
`y`	A numeric vector containing the response.
`sortTrt`	Logical: if TRUE, an attempt is made at sorting the predictor effects in descending order.
`includeIntercept`	Logical: if TRUE, the intercept effect is plotted; otherwise, it is omitted from the plot.
`type`	Character: hist, for histogram; dot, for stripchart

Value

A histogram or dotplot and rugplot

Author(s)

W. John Braun

Source

Braun, W.J. 2014. Visualization of Evidence in Regression Analysis with the QR Decomposition. Preprint.

Examples

```
# Example 1
X <- p4.18[,-4]

# An example where stepwise AIC selects the complement
# of the set of variables that are actually in the true model:
X <- pathoeg[,-10]
y <- pathoeg[,10]
par(mfrow=c(2,1))
GRegplot(X, y)
GRegplot(X, y, sortTrt=TRUE)
X <- table.b1[,-1]  # NFL data
y <- table.b1[,1]
GRegplot(X, y)
```

Juliet *Juliet*

Description

`Juliet` has 28 rows and 9 columns. The data is of the input and output of the Spirit Still "Juliet" from Endless Summer Distillery. It is suggested to split the data by the Batch factor for ease of use.

Usage

```
Juliet
```

Format

The data frame contains the following 9 columns.

`Batch` a Factor determing how many times the volume has been through the still.

`Vol1` Volume in litres, initial

`P1` Percent alcohol present, initial

`LAA1` Litres Absolute Alcohol initial, `Vol1*P1`

`Vol2` Volume in litres, final

`P2` Percent alcohol present, final

`LAA2` Litres Absolute Alcohol final, `Vol2*P2`

`Yield` Percent yield obtained, `LAA2/LAA1`

`Date` Character, Date of run

Details

The purpose of this information is to determine the optimal initial volume and percentage. The information is broken down by `Batch`. A batch factor 1 means that it is the first time the liquid has gone through the spirit still. The first run through the still should have the most loss due to the "heads" and "tails". Literature states that the first run through a spirit still should yield 70 percent. A batch factor 2 means that it is the second time the liquid has gone through the spirit still. A batch factor 3 means that it is the third time or more that the liquid has gone through the spirit still. Each subsequent distillation should result in a higher yield, never to exceed 95 percent.

Source

Charisse Woods, Endless Summer Distillery, (2015).

Examples

```
summary(Juliet)

#Split apart the Batch factor for easier use.
juliet<-split(Juliet,Juliet$Batch)
juliet1<-juliet$'1'
juliet2<-juliet$'2'
juliet3<-juliet$'3'

plot(LAA1~LAA2,data=Juliet)
plot(LAA1~LAA2,data=juliet1)
```

`oldwash` *oldwash*

Description

The `oldwash` dataframe has 49 rows and 8 columns. The data are from the start up of a wash still considering the amount of time it takes to heat up to a specified temperature and possible influencing factors.

Usage

```
data("oldwash")
```

Format

A data frame with 49 observations on the following 8 variables.

`Date` character, the date of the run

`startT` degrees Celsius, numeric, initial temperature

`endT` degrees Celsius, numeric, final temperature

`time` in minutes, numeric, amount of time to reach final temperature

`Vol` in litres, numeric, amount of liqiud in the tank (max 2000L)

`alc` numeric, the percentage of alcohol present in the liquid

`who` character, relates to the person who ran the still

`batch` factor with levels 1 = first time through, 2 = second time through

Details

The purpose of the wash still is to increase the percentage of alcohol and strip out unwanted particulate. It can take a long time to heat up and this can lead to problems in meeting production time limits.

Source

Charisse Woods, Endless Summer Distillery (2014)

Examples

```
oldwash.lm<-lm(log(time)~startT+endT+Vol+alc+who+batch,data=oldwash)
summary(oldwash.lm)
par(mfrow=c(2,2))
plot(oldwash.lm)

data2<-subset(oldwash,batch==2)
hist(data2$time)
data1<-subset(oldwash,batch==1)
hist(data1$time)

oldwash.lmc<-lm(time~startT+endT+Vol+alc+who+batch,data=data1)
summary(oldwash.lmc)
plot(oldwash.lmc)

oldwash.lmd<-lm(time~startT+endT+Vol+alc+who+batch,data=data2)
summary(oldwash.lmd)
plot(oldwash.lmd)
```

p11.12 *Data For Problem 11-12*

Description

The `p11.12` data frame has 19 observations on satellite cost.

Usage

```
data(p11.12)
```

Format

This data frame contains the following columns:

cost first-unit satellite cost

x weight of the electronics suite

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

References

Simpson and Montgomery (1998)

Examples

```
data(p11.12)
attach(p11.12)
plot(cost~x)
detach(p11.12)
```

p11.15 *Data set for Problem 11-15*

Description

The `p11.15` data frame has 9 rows and 2 columns.

Usage

```
data(p11.15)
```

Format

This data frame contains the following columns:

x a numeric vector

y a numeric vector

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

References

Ryan (1997), Stefanski (1991)

p12.11 *Data Set for Problem 12-11*

Description

The `p12.11` data frame has 44 observations on the fraction of active chlorine in a chemical product as a function of time after manufacturing.

Usage

```
data(p12.11)
```

Format

This data frame contains the following columns:

xi time

yi available chlorine

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(p12.11)
plot(p12.11)
lines(lowess(p12.11))
```

---

p12.12 *Data Set for Problem 12-12*

Description

The p12.12 data frame has 18 observations on an chemical experiment. A nonlinear model relating concentration to reaction time and temperature with an additive error is proposed to fit these data.

Usage

```
data(p12.12)
```

Format

This data frame contains the following columns:

x1 reaction time (in minutes)

x2 temperature (in degrees Celsius)

y concentration (in grams/liter)

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(p12.12)
attach(p12.12)
# fitting the linearized model
logy.lm <- lm(I(log(y))~I(log(x1))+I(log(x2)))
summary(logy.lm)
plot(logy.lm, which=1)  # checking the residuals
# fitting the nonlinear model
y.nls <- nls(y ~ theta1*I(x1^theta2)*I(x2^theta3), start=list(theta1=.95,
theta2=.76, theta3=.21))
 summary(y.nls)
 plot(resid(y.nls)~fitted(y.nls)) # checking the residuals
```

`p12.8` *Data Set for Problem 12-8*

Description

The `p12.8` data frame has 14 rows and 2 columns.

Usage

```
data(p12.8)
```

Format

This data frame contains the following columns:

x a numeric vector

y a numeric vector

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(p12.8)
```

`p13.1` *Data Set for Problem 13-1*

Description

The `p13.1` data frame has 25 observation on the test-firing results for surface-to-air missiles.

Usage

```
data(p13.1)
```

Format

This data frame contains the following columns:

x target speed (in Knots)

y hit (=1) or miss (=0)

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(p13.1)
```

`p13.16` *Data Set for Problem 13-16*

Description

The `p13.16` data frame has 16 rows and 5 columns.

Usage

```
data(p13.16)
```

Format

This data frame contains the following columns:

X1 a numeric vector

X2 a numeric vector

X3 a numeric vector

X4 a numeric vector

Y a numeric vector

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(p13.16)
```

`p13.2` *Data Set for Problem 13-2*

Description

The `p13.2` data frame has 20 observations on home ownership.

Usage

```
data(p13.2)
```

Format

This data frame contains the following columns:

x family income

y home ownership (1 = yes, 0 = no)

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(p13.2)
```

`p13.20` *Data Set for Problem 13-20*

Description

The `p13.20` data frame has 30 rows and 2 columns.

Usage

```
data(p13.20)
```

Format

This data frame contains the following columns:

yhat a numeric vector

resdev a numeric vector

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(p13.20)
```

---

p13.3 *Data Set for Problem 13-3*

Description

The `p13.3` data frame has 10 observations on the compressive strength of an alloy fastener used in aircraft construction.

Usage

```
data(p13.3)
```

Format

This data frame contains the following columns:

x load (in psi)

n sample size

r number failing

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(p13.3)
```

p13.4 *Data Set for Problem 13-4*

Description

The p13.4 data frame has 11 observations on the effectiveness of a price discount coupon on the purchase of a two-litre beverage.

Usage

```
data(p13.4)
```

Format

This data frame contains the following columns:

x discount

n sample size

r number redeemed

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(p13.4)
```

p13.5 *Data Set for Problem 13-5*

Description

The p13.5 data frame has 20 observations on new automobile purchases.

Usage

```
data(p13.5)
```

Format

This data frame contains the following columns:

x1 income

x2 age of oldest vehicle

y new purchase less than 6 months later (1=yes, 0=no)

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(p13.5)
```

---

p13.6 *Data Set for Problem 13-6*

Description

The `p13.6` data frame has 15 observations on the number of failures of a particular type of valve in a processing unit.

Usage

```
data(p13.6)
```

Format

This data frame contains the following columns:

valve type of valve

numfail number of failures

months months

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(p13.6)
```

`p13.7` *Data Set for Problem 13-7*

Description

The `p13.7` data frame has 44 observations on the coal mines of the Appalachian region of western Virginia.

Usage

```
data(p13.7)
```

Format

This data frame contains the following columns:

y number of fractures in upper seams of coal mines

x1 inner burden thickness (in feet), shortest distance between seam floor and the lower seam

x2 percent extraction of the lower previously mined seam

x3 lower seam height (in feet)

x4 time that the mine has been in operation (in years)

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

References

Myers (1990)

Examples

```
data(p13.7)
```

p14.1 *Data Set for Problem 14-1*

Description

The `p14.1` data frame has 15 rows and 3 columns.

Usage

```
data(p14.1)
```

Format

This data frame contains the following columns:

x a numeric vector

y a numeric vector

time a numeric vector

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(p14.1)
```

p14.2 *Data Set for Problem 14-2*

Description

The `p14.2` data frame has 18 rows and 3 columns.

Usage

```
data(p14.2)
```

Format

This data frame contains the following columns:

t a numeric vector

xt a numeric vector

yt a numeric vector

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(p14.2)
```

`p15.4` *Data Set for Problem 15-4*

Description

The `p15.4` data frame has 40 rows and 4 columns.

Usage

```
data(p15.4)
```

Format

This data frame contains the following columns:

x1 a numeric vector

x2 a numeric vector

y a numeric vector

set a factor with levels `e` and `p`

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(p15.4)
```

p2.10 *Data Set for Problem 2-10*

Description

The p2.10 data frame has 26 observations on weight and systolic blood pressure for randomly selected males in the 25-30 age group.

Usage

```
data(p2.10)
```

Format

This data frame contains the following columns:

weight in pounds

sysbp systolic blood pressure

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(p2.10)
attach(p2.10)
cor.test(weight, sysbp, method="pearson")  # tests rho=0
                                           # and computes 95% CI for rho
                                           # using Fisher's Z-transform
```

p2.12 *Data Set for Problem 2-12*

Description

The p2.12 data frame has 12 observations on the number of pounds of steam used per month at a plant and the average monthly ambient temperature.

Usage

```
data(p2.12)
```

Format

This data frame contains the following columns:

temp ambient temperature (in degrees F)

usage usage (in thousands of pounds)

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(p2.12)
attach(p2.12)
usage.lm <- lm(usage ~ temp)
summary(usage.lm)
predict(usage.lm, newdata=data.frame(temp=58), interval="prediction")
detach(p2.12)
```

---

p2.13 *Data Set for Problem 2-13*

Description

The p2.13 data frame has 16 observations on the number of days the ozone levels exceeded 0.2 ppm in the South Coast Air Basin of California for the years 1976 through 1991. It is believed that these levels are related to temperature.

Usage

```
data(p2.13)
```

Format

This data frame contains the following columns:

days number of days ozone levels exceeded 0.2 ppm

index a seasonal meteorological index giving the seasonal average 850 millibar temperature.

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

References

Davidson, A. (1993) Update on Ozone Trends in California's South Coast Air Basin. *Air Waste*, 43, 226-227.

Examples

```
data(p2.13)
attach(p2.13)
plot(days~index, ylim=c(-20,130))
ozone.lm <- lm(days ~ index)
summary(ozone.lm)
# plots of confidence and prediction intervals:
ozone.conf <- predict(ozone.lm, interval="confidence")
lines(sort(index), ozone.conf[order(index),2], col="red")
lines(sort(index), ozone.conf[order(index),3], col="red")
ozone.pred <- predict(ozone.lm, interval="prediction")
lines(sort(index), ozone.pred[order(index),2], col="blue")
lines(sort(index), ozone.pred[order(index),3], col="blue")
detach(p2.13)
```

---

p2.14 *Data Set for Problem 2-14*

Description

The p2.14 data frame has 8 observations on the molar ratio of sebacic acid and the intrinsic viscosity of copolyesters. One is interested in predicting viscosity from the sebacic acid ratio.

Usage

```
data(p2.14)
```

Format

This data frame contains the following columns:

ratio molar ratio

visc viscosity

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

References

Examples

```
data(p2.14)
attach(p2.14)
plot(p2.14, pch=16, ylim=c(0,1))
visc.lm <- lm(visc ~ ratio)
summary(visc.lm)
visc.conf <- predict(visc.lm, interval="confidence")
lines(ratio, visc.conf[,2], col="red")
lines(ratio, visc.conf[,3], col="red")
visc.pred <- predict(visc.lm, interval="prediction")
lines(ratio, visc.pred[,2], col="blue")
lines(ratio, visc.pred[,3], col="blue")
detach(p2.14)
```

---

p2.15 *Data Set for Problem 2-15*

Description

The `p2.15` data frame has 8 observations on the impact of temperature on the viscosity of toluene-tetralin blends. This particular data set deals with blends with a 0.4 molar fraction of toluene.

Usage

```
data(p2.15)
```

Format

This data frame contains the following columns:

temp temperature (in degrees Celsius)

visc viscosity (mPa s)

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

References

Examples

```
data(p2.15)
attach(p2.15)
plot(visc ~ temp, pch=16)
visc.lm <- lm(visc ~ temp)
plot(visc.lm, which=1)
detach(p2.15)
```

---

p2.16 *Data Set for Problem 2-16*

Description

The `p2.16` data frame has 33 observations on the pressure in a tank the volume of liquid.

Usage

```
data(p2.16)
```

Format

This data frame contains the following columns:

volume volume of liquid

pressure pressure in the tank

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

References

Carroll and Spiegelman (1986) The Effects of Ignoring Small Measurement Errors in Precision Instrument Calibration. Journal of Quality Technology, 18, 170-173.

Examples

```
data(p2.16)
attach(p2.16)
plot(pressure ~ volume, pch=16)
pressure.lm <- lm(pressure ~ volume)
plot(pressure.lm, which=1)
summary(pressure.lm)
detach(p2.16)
```

p2.7 *Data Set for Problem 2-7*

Description

The p2.7 data frame has 20 observations on the purity of oxygen produced by a fractionation process. It is thought that oxygen purity is related to the percentage of hydrocarbons in the main condensor of the processing unit.

Usage

```
data(p2.7)
```

Format

This data frame contains the following columns:

purity oxygen purity (percentage)

hydro hydrocarbon (percentage)

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(p2.7)
attach(p2.7)
purity.lm <- lm(purity ~ hydro)
summary(purity.lm)
# confidence interval for mean purity at 1% hydrocarbon:
predict(purity.lm,newdata=data.frame(hydro = 1.00),interval="confidence")
detach(p2.7)
```

p2.9 *Data Set for Problem 2-9*

Description

The p2.9 data frame has 25 rows and 2 columns. See help on softdrink for details.

Usage

```
data(p2.9)
```

Format

This data frame contains the following columns:

y a numeric vector

x a numeric vector

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(p2.9)
```

`p4.18` *Data Set for Problem 4-18*

Description

The `p4.18` data frame has 13 observations on an experiment to produce a synthetic analogue to jojoba oil.

Usage

```
data(p4.18)
```

Format

This data frame contains the following columns:

x1 reaction temperature

x2 initial amount of catalyst

x3 pressure

y yield

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

References

Coteron, Sanchez, Matinez, and Aracil (1993) Optimization of the Synthesis of an Analogue of Jojoba Oil Using a Fully Central Composite Design. Canadian Journal of Chemical Engineering.

Examples

```
data(p4.18)
y.lm <- lm(y ~ x1 + x2 + x3, data=p4.18)
summary(y.lm)
y.lm <- lm(y ~ x1, data=p4.18)
```

---

p4.19 *Data Set for Problem 4-19*

Description

The `p4.19` data frame has 14 observations on a designed experiment studying the relationship between abrasion index for a tire tread compound and three factors.

Usage

```
data(p4.19)
```

Format

This data frame contains the following columns:

x1 hydrated silica level

x2 silane coupling agent level

x3 sulfur level

y abrasion index for a tire tread compound

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

References

Derringer and Suich (1980) Simultaneous Optimization of Several Response Variables. Journal of Quality Technology.

Examples

```
data(p4.19)
attach(p4.19)
y.lm <- lm(y ~ x1 + x2 + x3)
summary(y.lm)
plot(y.lm, which=1)
y.lm <- lm(y ~ x1)
detach(p4.19)
```

p4.20 *Data Set for Problem 4-20*

Description

The p4.20 data frame has 26 observations on a designed experiment to determine the influence of five factors on the whiteness of rayon.

Usage

```
data(p4.20)
```

Format

This data frame contains the following columns:

acidtemp acid bath temperature

acidconc cascade acid concentration

watertemp water temperature

sulfconc sulfide concentration

amtbl amount of chlorine bleach

y a measure of the whiteness of rayon

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

References

Myers and Montgomery (1995) Response Surface Methodology, pp. 267-268.

Examples

```
data(p4.20)
y.lm <- lm(y ~ acidtemp, data=p4.20)
summary(y.lm)
```

p5.1 *Data Set for Problem 5-1*

Description

The p5.1 data frame has 8 observations on the impact of temperature on the viscosity of toluene-tetralin blends.

Usage

```
data(p5.1)
```

Format

This data frame contains the following columns:

temp temperature

visc viscosity

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

References

Byers and Williams (1987) Viscosities of Binary and Ternary Mixtures of Polyaromatic Hydrocarbons. Journal of Chemical and Engineering Data, 32, 349-354.

Examples

data(p5.1)
plot(p5.1)
```

p5.10 *Data Set for Problem 5-10*

Description

The p5.10 data frame has 27 observations on the effect of three factors on a printing machine's ability to apply coloring inks on package labels.

Usage

```
data(p5.10)
```

Format

This data frame contains the following columns:

x1 speed

x2 pressure

x3 distance

yi1 response 1

yi2 response 2

yi3 response 3

ybar.i average response

si standard deviation of the 3 responses

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(p5.10)
attach(p5.10)
y.lm <- lm(ybar.i ~ x1 + x2 + x3)
plot(y.lm, which=1)
detach(p5.10)
```

`p5.11` *Data Set for Problem 5-11*

Description

The `p5.11` data frame has 8 observations on an experiment with a catapult.

Usage

```
data(p5.11)
```

Format

This data frame contains the following columns:

x1 hook

x2 arm length

x3 start angle

x4 stop angle

yi1 response 1

yi2 response 2

yi3 response 3

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(p5.11)
attach(p5.11)
ybar.i <- apply(p5.11[,5:7], 1, mean)
sd.i <- apply(p5.11[,5:7], 1, sd)
y.lm <- lm(ybar.i ~ x1 + x2 + x3 + x4)
plot(y.lm, which=1)
detach(p5.11)
```

---

p5.2 *Data Set for Problem 5-2*

Description

The `p5.2` data frame has 11 observations on the vapor pressure of water for various temperatures.

Usage

```
data(p5.2)
```

Format

This data frame contains the following columns:

temp temperature (K)

vapor vapor pressure (mm Hg)

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(p5.2)
plot(p5.2)
```

p5.3 *Data Set for Problem 5-3*

Description

The `p5.3` data frame has 12 observations on the number of bacteria surviving in a canned food product and the number of minutes of exposure to 300 degree Fahrenheit heat.

Usage

```
data(p5.3)
```

Format

This data frame contains the following columns:

bact number of surviving bacteria

min number of minutes of exposure

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(p5.3)
plot(bact~min, data=p5.3)
```

p5.4 *Data Set for Problem 5-4*

Description

The `p5.4` data frame has 8 observations on 2 variables.

Usage

```
data(p5.4)
```

Format

This data frame contains the following columns:

x a numeric vector

y a numeric vector

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(p5.4)
plot(y ~ x, data=p5.4)
```

---

p5.5 *Data Set for Problem 5-5*

Description

The p5.5 data frame has 14 observations on the average number of defects per 10000 bottles due to stones in the bottle wall and the number of weeks since the last furnace overhaul.

Usage

```
data(p5.5)
```

Format

This data frame contains the following columns:

defects a numeric vector

weeks a numeric vector

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(p5.5)
defects.lm <- lm(defects~weeks, data=p5.5)
plot(defects.lm, which=1)
```

p7.1 *Data Set for Problem 7-1*

Description

The `p7.1` data frame has 10 observations on a predictor variable.

Usage

```
data(p7.1)
```

Format

This data frame contains the following columns:

x a numeric vector

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(p7.1)
attach(p7.1)
x2 <- x^2
detach(p7.1)
```

p7.11 *Data Set for Problem 7-11*

Description

The `p7.11` data frame has 11 observations on production cost versus production lot size.

Usage

```
data(p7.11)
```

Format

This data frame contains the following columns:

x production lot size

y average production cost per unit

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(p7.11)
plot(y ~ x, data=p7.11)
```

---

p7.15 *Data Set for Problem 7-15*

Description

The `p7.15` data frame has 6 observations on vapor pressure of water at various temperatures.

Usage

```
data(p7.15)
```

Format

This data frame contains the following columns:

y vapor pressure (mm Hg)

x temperature (degrees Celsius)

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(p7.15)
y.lm <- lm(y ~ x, data=p7.15)
plot(y ~ x, data=p7.15)
abline(coef(y.lm))
plot(y.lm, which=1)
```

p7.16 *Data Set for Problem 7-16*

Description

The p7.16 data frame has 26 observations on the observed mole fraction solubility of a solute at a constant temperature.

Usage

```
data(p7.16)
```

Format

This data frame contains the following columns:

y negative logarithm of the mole fraction solubility

x1 dispersion partial solubility

x2 dipolar partial solubility

x3 hydrogen bonding Hansen partial solubility

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

References

(1991) Journal of Pharmaceutical Sciences 80, 971-977.

Examples

```
data(p7.16)
pairs(p7.16)
```

p7.19 *Data Set for Problem 7-19*

Description

The p7.19 data frame has 10 observations on the concentration of green liquor and paper machine speed from a kraft paper machine.

Usage

```
data(p7.19)
```

Format

This data frame contains the following columns:

y green liquor (g/l)

x paper machine speed (ft/min)

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

References

(1986) Tappi Journal.

Examples

```
data(p7.19)
y.lm <- lm(y ~ x + I(x^2), data=p7.19)
summary(y.lm)
```

---

p7.2 *Data Set for Problem 7-2*

Description

The `p7.2` data frame has 10 observations on solid-fuel rocket propellant weight loss.

Usage

```
data(p7.2)
```

Format

This data frame contains the following columns:

x months since production

y weight loss (kg)

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(p7.2)
y.lm <- lm(y ~ x + I(x^2), data=p7.2)
summary(y.lm)
plot(y ~ x, data=p7.2)
```

p7.4 *Data Set for Problem 7-4*

Description

The `p7.4` data frame has 12 observations on two variables.

Usage

```
data(p7.4)
```

Format

This data frame contains the following columns:

x a numeric vector

y a numeric vector

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(p7.4)
y.lm <- lm(y ~ x + I(x^2), data = p7.4)
summary(y.lm)
```

p7.6 *Data Set for Problem 7-6*

Description

The `p7.6` data frame has 12 observations on softdrink carbonation.

Usage

```
data(p7.6)
```

Format

This data frame contains the following columns:

y carbonation

x1 temperature

x2 pressure

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(p7.6)
y.lm <- lm(y ~ x1 + I(x1^2) + x2 + I(x2^2) + I(x1*x2), data=p7.6)
summary(y.lm)
```

---

p8.11 *Data Set for Problem 8-11*

Description

The p8.11 data frame has 25 observations on the tensile strength of synthetic fibre used for men's shirts.

Usage

```
data(p8.11)
```

Format

This data frame contains the following columns:

y tensile strength

percent percentage of cotton

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

References

Montgomery (2001)

Examples

```
data(p8.11)
y.lm <- lm(y ~ percent, data=p8.11)
model.matrix(y.lm)
```

p8.3 *Data Set for Problem 8-3*

Description

The `p8.3` data frame has 25 observations on delivery times taken by a vending machine route driver.

Usage

```
data(p8.3)
```

Format

This data frame contains the following columns:

y delivery time (in minutes)

x1 number of cases of product stocked

x2 distance walked by route driver

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(p8.3)
pairs(p8.3)
```

p9.10 *Data Set for Problem 9-10*

Description

The `p9.10` data frame has 31 observations on the rut depth of asphalt pavements prepared under different conditions.

Usage

```
data(p9.10)
```

Format

This data frame contains the following columns:

y change in rut depth/million wheel passes (log scale)

x1 viscosity (log scale)

x2 percentage of asphalt in surface course

x3 percentage of asphalt in base course

x4 indicator

x5 percentage of fines in surface course

x6 percentage of voids in surface course

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

References

Gorman and Toman (1966)

Examples

```
data(p9.10)
pairs(p9.10)
```

`pathoeg` *Pathological Example*

Description

Artificial regression data which causes stepwise regression with AIC to produce a highly non-parsimonious model. The true model used to simulate the data has only one real predictor (x8).

Usage

```
litters
```

Format

This data frame contains the following columns:

x1 a numeric vector

x2 a numeric vector

x3 a numeric vector

x4 a numeric vector

x5 a numeric vector

x6 a numeric vector

x7 a numeric vector

x8 a numeric vector

x9 a numeric vector

y a numeric vector

PRESS *PRESS statistic*

Description

Computation of Allen's PRESS statistic for an lm object.

Usage

```
PRESS(x)
```

Arguments

x	An `lm` object

Value

Allen's PRESS statistic.

Author(s)

W.J. Braun

See Also

`lm`

Examples

```
data(p4.18)
attach(p4.18)
y.lm <- lm(y ~ x1 + I(x1^2))
PRESS(y.lm)
detach(p4.18)
```

qqANOVA *QQ Plot for Analysis of Variance*

Description

This function is used to display the weight of the evidence against null main effects in data coming from a 1 factor design, using a QQ plot. In practice this method is often called via the function GANOVA.

Usage

```
qqANOVA(x, y, plot.it = TRUE, xlab = deparse(substitute(x)),
    ylab = deparse(substitute(y)), ...)
```

Arguments

`x`	numeric vector of errors
`y`	numeric vector of scaled responses
`plot.it`	logical vector indicating whether to plot or not
`xlab`	character, x-axis label
`ylab`	character, y-axis label
`...`	any other arguments for the plot function

Value

A QQ plot is drawn.

Author(s)

W. John Braun

quadline *Quadratic Overlay*

Description

Overlays a quadratic curve to a fitted quadratic model.

Usage

```
quadline(lm.obj, ...)
```

Arguments

`lm.obj`	A `lm` object (a quadratic fit)
`...`	Other arguments to the `lines` function; e.g. `col`

Value

The function superimposes a quadratic curve onto an existing scatterplot.

Author(s)

W.J. Braun

See Also

`lm`

Examples

```
data(p4.18)
attach(p4.18)
y.lm <- lm(y ~ x1 + I(x1^2))
plot(x1, y)
quadline(y.lm)
detach(p4.18)
```

Qyplot *Analysis of Variance Plot for Regression*

Description

This function analyzes regression data graphically. It allows visualization of the usual F-test for significance of regression.

Usage

```
Qyplot(X, y, plotIt=TRUE, sortTrt=FALSE, type="hist", includeIntercept=TRUE, labels=FALSE)
```

Arguments

`X`	The design matrix.
`y`	A numeric vector containing the response.
`plotIt`	Logical: if TRUE, a graph is drawn.
`sortTrt`	Logical: if TRUE, an attempt is made at sorting the predictor effects in descending order.
`type`	"QQ" or "hist"

includeIntercept
: Logical: if TRUE, the intercept effect is plotted; otherwise, it is omitted from the plot.

labels
: logical: if TRUE, names of predictor variables are used as labels; otherwise, the design matrix column numbers are used as labels

Value

A QQ-plot or a histogram and rugplot, or a list if plotIt=FALSE

Author(s)

W. John Braun

Source

Braun, W.J. 2013. Regression Analysis and the QR Decomposition. Preprint.

Examples

```
# Example 1
X <- p4.18[,-4]
y <- p4.18[,4]
Qyplot(X, y, type="hist", includeIntercept=FALSE)
title("Evidence of Regression in the Jojoba Oil Data")
# Example 2
set.seed(4571)
Z <- matrix(rnorm(400), ncol=10)
A <- matrix(rnorm(81), ncol=9)
simdata <- data.frame(Z[,1], crossprod(t(Z[,-1]),A))
names(simdata) <- c("y", paste("x", 1:9, sep=""))
Qyplot(simdata[,-1], simdata[,1], type="hist", includeIntercept=FALSE)
title("Evidence of Regression in Simulated Data Set")
# Example 3
Qyplot(table.b1[,-1], table.b1[,1], type="hist", includeIntercept=FALSE)
title("Evidence of Regression in NFL Data Set")
# An example where stepwise AIC selects the complement
# of the set of variables that are actually in the true model:
X <- pathoeg[,-10]
y <- pathoeg[,10]
par(mfrow=c(2,2))
Qyplot(X, y)
Qyplot(X, y, sortTrt=TRUE)
Qyplot(X, y, type="QQ")
Qyplot(X, y, sortTrt=TRUE, type="QQ")
X <- table.b1[,-1]  # NFL data
y <- table.b1[,1]
Qyplot(X, y)
```

softdrink *Softdrink Data*

Description

The `softdrink` data frame has 25 rows and 3 columns.

Usage

```
data(softdrink)
```

Format

This data frame contains the following columns:

y a numeric vector

x1 a numeric vector

x2 a numeric vector

Source

Examples

```
data(softdrink)
```

solar *Solar Data*

Description

The `solar` data frame has 29 rows and 6 columns.

Usage

```
data(solar)
```

Format

This data frame contains the following columns:

total.heat.flux a numeric vector

insolation a numeric vector

focal.pt.east a numeric vector

focal.pt.south a numeric vector

focal.pt.north a numeric vector

time.of.day a numeric vector

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(solar)
```

`stackloss` *Stackloss Data*

Description

The `stackloss` data frame has 21 rows and 4 columns.

Usage

```
data(stackloss)
```

Format

This data frame contains the following columns:

y a numeric vector

x1 a numeric vector

x2 a numeric vector

x3 a numeric vector

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(stackloss)
```

`table.b1` *Table B1*

Description

The `table.b1` data frame has 28 observations on National Football League 1976 Team Performance.

Usage

```
data(table.b1)
```

Format

This data frame contains the following columns:

y Games won in a 14 game season

x1 Rushing yards

x2 Passing yards

x3 Punting average (yards/punt)

x4 Field Goal Percentage (FGs made/FGs attempted)

x5 Turnover differential (turnovers acquired - turnovers lost)

x6 Penalty yards

x7 Percent rushing (rushing plays/total plays)

x8 Opponents' rushing yards

x9 Opponents' passing yards

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(table.b1)
attach(table.b1)
y.lm <- lm(y ~ x2 + x7 + x8)
summary(y.lm)
# over-all F-test:
y.null <- lm(y ~ 1)
anova(y.null, y.lm)
# partial F-test for x7:
y7.lm <- lm(y ~ x2 + x8)
anova(y7.lm, y.lm)
detach(table.b1)
```

table.b10 *Table B10*

Description

The `table.b10` data frame has 40 observations on kinematic viscosity of a certain solvent system.

Usage

```
data(table.b10)
```

Format

This data frame contains the following columns:

x1 Ratio of 2-methoxyethanol to 1,2-dimethoxyethane

x2 Temperature (in degrees Celsius)

y Kinematic viscosity (.000001 m2/s

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

summary(y.lm)
detach(table.b10)
```

`table.b11` *Table B11*

Description

The `table.b11` data frame has 38 observations on the quality of Pinot Noir wine.

Usage

```
data(table.b11)
```

Format

This data frame contains the following columns:

Clarity a numeric vector

Aroma a numeric vector

Body a numeric vector

Flavor a numeric vector

Oakiness a numeric vector

Quality a numeric vector

Region a numeric vector

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(table.b11)
attach(table.b11)
Quality.lm <- lm(Quality ~ Clarity + Aroma + Body + Flavor + Oakiness +
factor(Region))
summary(Quality.lm)
detach(table.b11)
```

`table.b12` *Table B12*

Description

The `table.b12` data frame has 32 rows and 6 columns.

Usage

```
data(table.b12)
```

Format

This data frame contains the following columns:

temp a numeric vector

soaktime a numeric vector

soakpct a numeric vector

difftime a numeric vector

diffpct a numeric vector

pitch a numeric vector

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(table.b12)
```

`table.b13` *Table B13*

Description

The `table.b13` data frame has 40 rows and 7 columns.

Usage

```
data(table.b13)
```

Format

This data frame contains the following columns:

y a numeric vector

x1 a numeric vector

x2 a numeric vector

x3 a numeric vector

x4 a numeric vector

x5 a numeric vector

x6 a numeric vector

Source

Examples

```
data(table.b13)
```

`table.b14` *Table B14*

Description

The `table.b14` data frame has 25 observations on the transient points of an electronic inverter.

Usage

```
data(table.b14)
```

Format

This data frame contains the following columns:

x1 width of the NMOS Device

x2 length of the NMOS Device

x3 width of the PMOS Device

x4 length of the PMOS Device

x5 a numeric vector

y transient point of PMOS-NMOS Inverters

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(table.b14)
y.lm <- lm(y ~ x1 + x2 + x3 + x4, data=table.b14)
plot(y.lm, which=1)
```

---

table.b2 *Table B2*

Description

The `table.b2` data frame has 29 rows and 6 columns.

Usage

```
data(table.b2)
```

Format

This data frame contains the following columns:

y a numeric vector

x1 a numeric vector

x2 a numeric vector

x3 a numeric vector

x4 a numeric vector

x5 a numeric vector

Source

Montgomery, D.C., Peck, E.A., and Vining, C.G. (2001) Introduction to Linear Regression Analysis. 3rd Edition, John Wiley and Sons.

Examples

```
data(table.b2)
```

table.b3 *Table B3*

Description

The `table.b3` data frame has observations on gasoline mileage performance for 32 different automobiles.

Usage

```
data(table.b3)
```

Format

This data frame contains the following columns:

y Miles/gallon

x1 Displacement (cubic in)

x2 Horsepower (ft-lb)

x3 Torque (ft-lb)

x4 Compression ratio

x5 Rear axle ratio

x6 Carburetor (barrels)

x7 No. of transmission speeds

x8 Overall length (in)

x9 Width (in)

x10 Weight (lb)

x11 Type of transmission (1=automatic, 0=manual)

Examples

```
data(table.b3)
attach(table.b3)
y.lm <- lm(y ~ x1 + x6)
summary(y.lm)
# testing for the significance of the regression:
y.null <- lm(y ~ 1)
anova(y.null, y.lm)
# 95% CI for mean gas mileage:
predict(y.lm, newdata=data.frame(x1=275, x6=2), interval="confidence")
# 95% PI for gas mileage:
predict(y.lm, newdata=data.frame(x1=275, x6=2), interval="prediction")
detach(table.b3)
```

`table.b4` *Table B4*

Description

The `table.b4` data frame has 24 observations on property valuation.

Usage

```
data(table.b4)
```

Format

This data frame contains the following columns:

y sale price of the house (in thousands of dollars)

x1 taxes (in thousands of dollars)

x2 number of baths

x3 lot size (in thousands of square feet)

x4 living space (in thousands of square feet)

x5 number of garage stalls

x6 number of rooms

x7 number of bedrooms

x8 age of the home (in years)

x9 number of fireplaces

Examples

```
data(table.b4)
attach(table.b4)
y.lm <- lm(y ~ x1 + x2 + x3 + x4 + x5 + x6 + x7 + x8 + x9)
summary(y.lm)
detach(table.b4)
```

`table.b5` *Data Set for Table B5*

Description

The `table.b5` data frame has 27 observations on liquefaction.

Usage

```
data(table.b5)
```

Format

This data frame contains the following columns:

y CO2

x1 Space time (in min)

x2 Temperature (in degrees Celsius)

x3 Percent solvation

x4 Oil yield (g/100g MAF)

x5 Coal total

x6 Solvent total

x7 Hydrogen consumption

Examples

```
data(table.b5)
attach(table.b5)
y.lm <- lm(y ~ x6 + x7)
summary(y.lm)
detach(table.b5)
```

---

table.b6 *Data Set for Table B6*

Description

The `table.b6` data frame has 28 observations on a tube-flow reactor.

Usage

```
data(table.b6)
```

Format

This data frame contains the following columns:

y Nb0Cl3 concentration (g-mol/l)

x1 COCl2 concentration (g-mol/l)

x2 Space time (s)

x3 Molar density (g-mol/l)

x4 Mole fraction CO2

attach(table.b6)
y.lm <- lm(y ~ x1 + x4)
summary(y.lm)
detach(table.b6)
```

table.b7 *Data Set for Table B7*

Description

The `table.b7` data frame has 16 observations on oil extraction from peanuts.

Usage

```
data(table.b7)
```

Format

This data frame contains the following columns:

x1 CO2 pressure (bar)

x2 CO2 temperature (in degrees Celsius)

x3 peanut moisture (percent by weight)

x4 CO2 flow rate (L/min)

x5 peanut particle size (mm)

y total oil yield

```
data(table.b7)
attach(table.b7)
# partial solution to Problem 3.11:
peanuts.lm <- lm(y ~ x1 + x2 + x3 + x4 + x5)
summary(peanuts.lm)
detach(table.b7)
```

`table.b8` *Table B8*

Description

The `table.b8` data frame has 36 observations on Clathrate formation.

Usage

```
data(table.b8)
```

Format

This data frame contains the following columns:

x1 Amount of surfactant (mass percentage)

x2 Time (min)

y Clathrate formation (mass percentage)

Source

```
data(table.b8)
attach(table.b8)
clathrate.lm <- lm(y ~ x1 + x2)
summary(clathrate.lm)
detach(table.b8)
```

table.b9 *Data Set for Table B9*

Description

The `table.b9` data frame has 62 observations on an experimental pressure drop.

Usage

```
data(table.b9)
```

Format

This data frame contains the following columns:

x1 Superficial fluid velocity of the gas (cm/s)

x2 Kinematic viscosity

x3 Mesh opening (cm)

x4 Dimensionless number relating superficial fluid velocity of the gas to the superficial fluid velocity of the liquid

y Dimensionless factor for the pressure drop through a bubble cap

data(table.b9)
attach(table.b9)
# Partial Solution to Problem 3.13:
y.lm <- lm(y ~ x1 + x2 + x3 + x4)
summary(y.lm)
detach(table.b9)
```

---

tplot *Graphical t Test for Regression*

Description

This function analyzes regression data graphically. It allows visualization of the usual t-tests for individual regression coefficients.

Usage

```
tplot(X, y, plotIt=TRUE, type="hist", includeIntercept=TRUE)
```

Arguments

`X`	The design matrix.
`y`	A numeric vector containing the response.
`plotIt`	Logical: if TRUE, a graph is drawn.
`type`	"QQ" or "hist"
`includeIntercept`	Logical: if TRUE, the intercept effect is plotted; otherwise, it is omitted from the plot.

Value

A QQ-plot or a histogram and rugplot, or a list if plotIt=FALSE

Author(s)

W. John Braun

Examples

```
# Jojoba oil data set
X <- p4.18[,-4]
y <- p4.18[,4]
tplot(X, y, type="hist", includeIntercept=FALSE)
title("Tests for Individual Coefficients in the Jojoba Oil Regression")
# Simulated data set where none of the predictors are in the true model:
set.seed(4571)
Z <- matrix(rnorm(400), ncol=10)
A <- matrix(rnorm(81), ncol=9)
simdata <- data.frame(Z[,1], crossprod(t(Z[,-1]),A))
names(simdata) <- c("y", paste("x", 1:9, sep=""))
X <- simdata[,-1]
y <- simdata[,1]
tplot(X, y, type="hist", includeIntercept=FALSE)
title("Tests for Individual Coefficients for the Simulated Data Set")
# NFL Data set:
```

```
X <- table.b1[,-1]
y <- table.b1[,1]
tplot(X, y, type="hist", includeIntercept=FALSE)
title("Tests for Individual Coefficients for the NFL Data Set")
# Simulated Data set where x8 is the only predictor in the true model:
X <- pathoeg[,-10]
y <- pathoeg[,10]
par(mfrow=c(2,2))
tplot(X, y)
tplot(X, y, type="QQ")
```

`Uplot` *Plot of Multipliers in Regression ANOVA Plot*

Description

This function graphically displays the coefficient multipliers used in the Regression Plot for the given predictor.

Usage

```
Uplot(X.qr, Xcolumn = 1, ...)
```

Arguments

`X.qr`	The design matrix or the QR decomposition of the design matrix.
`Xcolumn`	The column(s) of the design matrix under study; this can be either integer valued or a character string.
`...`	Additional arguments to barchart.

Value

A bar plot is displayed.

Author(s)

W. John Braun

Examples

```
# Jojoba oil data set
X <- p4.18[,-4]
Uplot(X, 1:4)
# NFL data set; see GFplot result first
X <- table.b1[,-1]
Uplot(X, c(2,3,9))
# In this example, x8 is the only predictor in
# the true model:
X <- pathoeg[,-10]
```

```
y <- pathoeg[,10]
pathoeg.F <- GFplot(X, y, plotIt=FALSE)
Uplot(X, "x8")
Uplot(X, 9) # same as above
Uplot(pathoeg.F$QR, 9) # same as above
X <- table.b1[,-1]
Uplot(X, c("x2", "x3", "x9"))
```
